Networking Project 2: Talking in HTTP

Objective: Write a program that prints the IP address of hostnames like www.google.com and gaia.cs.umass.edu. It should also send a HTTP request to them and print the reply.

Constraints: use only the socket module.

Bonus: Send a HTTPS request to them and print the reply. For this one you can add any other module along side the socket module.

Questions:
What is a port?
What is the port for HTTP and HTTPS?
What is a socket in networking?
Why is HTTP unsafe?

Networking Project 1: Get Host Name and Local IP Address

Objective: Write a program that prints the host name and local IP address of your computer.

Constraint: Use only the socket module

Questions:
Who decided what your host name was?
Who decided what your local IP address was?
What is/can the value of your host name and/or local IP address be used for?
